

Forget Password performs setup

To send OTP emails from your PHP project using Gmail, you must follow **3 important steps**.

Page:forget_password.php

❑ STEP 1 — Turn ON Google 2-Step Verification

Gmail does **not allow normal password** for sending emails through apps. You must enable **2-Step Verification** first.

How?

1. Go to: <https://myaccount.google.com/>
2. Click **Security**
3. Find **2-Step Verification**
4. Turn it ON
5. Verify your phone number

- ✓ This step is required
 - ✓ Without 2-Step Verification, you cannot create an App Password
-

❑ STEP 2 — Create a Gmail App Password

PHPMailer **cannot use your normal Gmail password**. You must generate a special password called **App Password**.

How?

1. After 2-Step Verification is ON
2. Scroll down and open **App Passwords**
3. Click **Select App** → choose **Mail**
4. Click **Select Device** → choose **Other (Custom)**
5. Type: **PHP App**
6. Click **Generate**

Gmail will give you a **16-digit password**, like:

abcd efgh ijkl mnop

- ✓ This is the password you must use in PHPMailer
 - ✓ Do **NOT** share it with anyone
 - ✓ It works forever unless you delete it
-

❑ STEP 3 — Use Gmail SMTP Settings in PHPMailer

In your PHP file, use these settings:

```
$mail->isSMTP();  
$mail->Host = 'smtp.gmail.com';  
$mail->SMTPAuth = true;  
$mail->Username = 'yourgmail@gmail.com'; // your Gmail  
$mail->Password = 'YOUR_APP_PASSWORD'; // the 16-digit password  
$mail->SMTPSecure = PHPMailer::ENCRYPTION_STARTTLS;  
$mail->Port = 587;
```

- ✓ Username = Your Gmail address
- ✓ Password = The App Password from Step 2
- ✓ Port = 587
- ✓ Encryption = TLS

Now Gmail will allow your PHP script to send emails.

Send email setup

☐ **PART 1 — GMAIL SETUP (Required)**

Page:Send_email.php

1.Turn On 2-Step Verification

Gmail will not allow app passwords unless you enable this.

Steps:

1. Go to <https://myaccount.google.com/>
2. Click Security
3. Turn ON 2-Step Verification
4. Verify your phone

2. Generate App Password

PHPMailer cannot use your normal Gmail password.

Steps:

1. After enabling 2-Step Verification
2. Go to App Passwords
3. Select Mail
4. Select device → choose Other
5. Type name (e.g., "PHP Email")

3. Click Generate

You get a 16-character password** like:

abcd efgh ijkl mnop

This is what you use in PHPMailer → NOT your Gmail password.

4. Use Gmail SMTP Settings

These values must be used:

Host: smtp.gmail.com

Port: 587

Encryption: TLS

SMTP Auth: true

Username: your Gmail

Password: your App Password

Whatsapp connection setup

Page: `forget_password.php`

STEP 1 — Create a GreenAPI Account

1. Go to <https://green-api.com/>
2. Click Login / Register
3. Create your account using email or Google login.

STEP 2 — Create an Instance

1. After login, go to your Dashboard
2. Click Create Instance
3. It will generate:

*** **Instance ID****

*** **API Token****

These two are used in your PHP code.

Example you used:

`idInstance = 7105409128`

`apiToken = 1a97827c4de5...`

STEP 3 — Connect Your WhatsApp (ONE TIME ONLY)

1. Open the instance you created
2. Click QR Code section
3. Scan QR using your WhatsApp Mobile App → Linked Devices
4. Your WhatsApp will link to GreenAPI

✓ You only need to do this ONE TIME

After connection is made, GreenAPI stays connected even if you close WhatsApp even if you logout from website even if you remove the QR.

□ But if you DELIBERATELY click “Log out from all devices” inside WhatsApp

Then connection breaks.

✓ Even if your phone screen is off

WhatsApp connection still works.

STEP 4 — Add Your Allowed Numbers

GreenAPI free plan only allows sending messages to:

* Your own number

* Numbers added in **“Allowed Numbers”** in dashboard

Steps:

1. Go to **Dashboard → Settings → Allowed Numbers**
2. Add:

* Your phone number

* Customer’s number

* Owner’s number

STEP 5 — Copy Credentials Into Your PHP Code

```
```php
```

```
$idInstance = "7105409128";
```

```
$apiToken = "1a97827c4de5419287afc6a4b9670a64f3226f94ae53461988";
```

```
```
```

Use **your owner number**:

```
```php
```

```
$owner_phone = ".....";``
```

GreenAPI Chat ID:

php

```
$chatId = ".....@c.us";
```

✓ This is correct.

### **STEP 6 — Send Message Using API URL\*\***

```
``php
```

```
$url = "https://api.green-api.com/waInstance{$idInstance}/sendMessage/{$apiToken}";
```

```
``
```

Send using cURL → already correct in your code.

### **STEP 7 — Test Message in Dashboard\*\***

Go to:

Dashboard → Testing → Send Message\*\*

Try sending message from there.

If it works, your PHP code will also work.
